## Question 13.4:

Arrange the following in increasing order of their basic strength:

- (i)  $C_2H_5NH_2$ ,  $C_6H_5NH_2$ ,  $NH_3$ ,  $C_6H_5CH_2NH_2$  and  $(C_2H_5)_2NH$
- (ii)  $C_2H_5NH_2$ ,  $(C_2H_5)_2NH$ ,  $(C_2H_5)_3N$ ,  $C_6H_5NH_2$
- (iii)  $CH_3NH_2$ ,  $(CH_3)_2NH$ ,  $(CH_3)_3N$ ,  $C_6H_5NH_2$ ,  $C_6H_5CH_2NH_2$ .

Answer

(i) Considering the inductive effect of alkyl groups,  $NH_3$ ,  $C_2H_5NH_2$ , and  $(C_2H_5)_2NH$  can be arranged in the increasing order of their basic strengths as:

$$NH_1 < C_2H_5NH_3 < (C_3H_5), NH_3$$

Again, C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> has proton acceptability less than NH<sub>3</sub>. Thus, we have:

$$C_6H_5NH_7 < NH_3 < C_7H_5NH_7 < (C_7H_5), NH$$

Due to the -I effect of  $C_6H_5$  group, the electron density on the N-atom in  $C_6H_5CH_2NH_2$  is lower than that on the N-atom in  $C_2H_5NH_2$ , but more than that in  $NH_3$ . Therefore, the given compounds can be arranged in the order of their basic strengths as:

$$C_6H_5NH_2 < NH_3 < C_6H_5CH_2NH_2 < C_2H_5NH_2 < (C_2H_5)_2NH_2$$

(ii) Considering the inductive effect and the steric hindrance of the alkyl groups,  $C_2H_5NH_2$ ,  $(C_2H_5)_2NH_2$ , and their basic strengths as follows:

$$C_1H_2NH_3 < (C_1H_2)_1N < (C_2H_3)_1NH$$

Again, due to the -R effect of  $C_6H_5$  group, the electron density on the N atom in  $C_6H_5$  NH<sub>2</sub> is lower than that on the N atom in  $C_2H_5NH_2$ . Therefore, the basicity of  $C_6H_5NH_2$  is lower than that of  $C_2H_5NH_2$ . Hence, the given compounds can be arranged in the increasing order of their basic strengths as follows:

$$C_6H_5NH_2 < C_2H_5NH_2 < (C_2H_5)_3N < (C_2H_5)_2NH$$

(iii) Considering the inductive effect and the steric hindrance of alkyl groups,  $CH_3NH_2$ ,  $(CH_3)_2NH$ , and  $(CH_3)_3N$  can be arranged in the increasing order of their basic strengths as:

$$(CH_3)_3N < CH_3NH_2 < (CH_3)_2NH$$

In  $C_6H_5NH_2$ , N is directly attached to the benzene ring. Thus, the lone pair of electrons on the N-atom is delocalized over the benzene ring. In  $C_6H_5CH_2NH_2$ , N is not directly attached to the benzene ring. Thus, its lone pair is not delocalized over the benzene ring. Therefore, the electrons on the N atom are more easily available for protonation in

C<sub>6</sub>H<sub>5</sub>CH<sub>2</sub>NH<sub>2</sub> than in C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub> i.e., C<sub>6</sub>H<sub>5</sub>CH<sub>2</sub>NH<sub>2</sub> is more basic than C<sub>6</sub>H<sub>5</sub>NH<sub>2</sub>.

Again, due to the -I effect of  $C_6H_5$  group, the electron density on the N-atom in  $C_6H_5CH_2NH_2$  is lower than that on the N-atom in  $(CH_3)_3N$ . Therefore,  $(CH_3)_3N$  is more basic

than  $C_6H_5CH_2NH_2$ . Thus, the given compounds can be arranged in the increasing order of their basic strengths as follows.

$$C_6H_5NH_7 < C_6H_5CH_7NH_7 < (CH_3)_1N < CH_1NH_7 < (CH_3)_1NH_7$$
