# Chemistry

# (Chapter 6)(Thermodynamics) XI

# **Question 6.1:**

Choose the correct answer. A thermodynamic state function is a quantity

(i) used to determine heat changes

(ii) whose value is independent of path (iii)

used to determine pressure volume work

(iv) whose value depends on temperature only.

Answer

A thermodynamic state function is a quantity whose value is independent of a path. Functions like p, V, T etc. depend only on the state of a system and not on the path. Hence, alternative (ii) is correct.

# Question 6.2:

For the process to occur under adiabatic conditions, the correct condition is:

- (i)  $\Delta T = 0$
- (ii)  $\Delta p = 0$
- (iii) q = 0
- (iv) w = 0

Answer

A system is said to be under adiabatic conditions if there is no exchange of heat between the system and its surroundings. Hence, under adiabatic conditions, q = 0. Therefore, alternative (iii) is correct.

Question 6.3:

The enthalpies of all elements in their standard states are:

- (i) unity
- (ii) zero
- (iii) < 0

(iv) different for each element

Answer

The enthalpy of all elements in their standard state is zero.

Therefore, alternative (ii) is correct.

Question 6.4:

 $\Delta U^{\theta}$  of combustion of methane is – X kJ mol<sup>-1</sup>. The value of  $\Delta H^{\theta}$  is

(i)  $= \Delta U^{\theta}$ (ii)  $> \Delta U^{\theta}$ (iii)  $< \Delta U^{\theta}$ (iv) = 0Answer Since  $\Delta H^{\theta} = \Delta U^{\theta} + \Delta n_g RT$  and  $\Delta U^{\theta} = -X$  kJ mol<sup>-1</sup>,  $\Delta H^{\theta} = (-X) + \Delta n_g RT$ .  $\Rightarrow \Delta H^{\theta} < \Delta U^{\theta}$ 

Therefore, alternative (iii) is correct.

## **Question 6.5:**

The enthalpy of combustion of methane, graphite and dihydrogen at 298 K are, -890.3 kJ mol<sup>-1</sup> -393.5 kJ mol<sup>-1</sup>, and -285.8 kJ mol<sup>-1</sup> respectively. Enthalpy of formation of

per."

 $CH_{4(g)}$  will be

(i) -74.8 kJ mol <sup>-1</sup>	(ii) −52.27 kJ mol <sup>-1</sup>
(iii) +74.8 kJ mol <sup>-1</sup>	(iv) +52.26 kJ mol <sup>-1</sup> .

Answer

According to the question,

(i) 
$$CH_{4(g)} + 2O_{2(g)} \longrightarrow CO_{2(g)} + 2H_2O_{(g)}$$
  
$$\Delta H = -890.3 \text{ kJ mol}^{-1}$$

(ii) 
$$C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)}$$

 $\Delta H = -393.5 \text{ kJ mol}^{-1}$ 

(iii)  $2H_{2(g)} + O_{2(g)} \longrightarrow 2H_2O_{(g)}$ 

 $\Delta H = -285.8 \text{ kJ mol}^{-1}$ 

Thus, the desired equation is the one that represents the formation of CH<sub>4</sub> (g) i.e.,

 $C_{(s)} + 2H_{2(g)} \longrightarrow CH_{4(g)}$   $\Delta_f H_{CH_4} = \Delta_c H_c + 2\Delta_c H_{H_2} - \Delta_c H_{CO_2}$   $= \left[-393.5 + 2\left(-285.8\right) - \left(-890.3\right)\right] \text{ kJ mol}^{-1}$   $= -74.8 \text{ kJ mol}^{-1}$   $\therefore \text{ Enthalpy of formation of } CH_{4(g)} = -74.8 \text{ kJ mol}^{-1} \text{ Hence,}$ 

alternative (i) is correct.

**Question 6.6:** 

A reaction, A + B  $\rightarrow$  C + D + q is found to have a positive entropy change. The reaction will be

- (i) possible at high temperature
- (ii) possible only at low temperature
- (iii) not possible at any temperature
- (iv) possible at any temperature

Answer

For a reaction to be spontaneous,  $\Delta G$  should be negative.

 $\Delta G = \Delta H - T \Delta S$ 

According to the question, for the given reaction,

 $\Delta S = \text{positive}$ 

 $\Delta H$  = negative (since heat is evolved)

 $\Rightarrow \Delta G = negative$ 

Therefore, the reaction is spontaneous at any temperature.

Hence, alternative (iv) is correct.

**Question 6.7:** 

In a process, 701 J of heat is absorbed by a system and 394 J of work is done by the system. What is the change in internal energy for the process?

Answer

According to the first law of thermodynamics,

 $\Delta U = q + W(i)$ 

#### Where,

 $\Delta U = \text{change in internal energy for a process } q$ = heat W = work Given,q = + 701 J (Since heat is absorbed)W = -394 J (Since work is done by the system)Substituting the values in expression (i), we get  $\Delta U = 701 \text{ J } + (-394 \text{ J})$  $\Delta U = 307 \text{ J}$ Hence, the change in internal energy for the given process is 307 J.

#### **Question 6.8:**

The reaction of cyanamide,  $NH_2CN_{(s)}$ , with dioxygen was carried out in a bomb calorimeter, and  $\Delta U$  was found to be -742.7 kJ mol<sup>-1</sup> at 298 K. Calculate enthalpy change for the reaction at 298 K.

$$\mathrm{NH}_2\mathrm{CN}_{(g)} + \frac{3}{2}\mathrm{O}_{2(g)} \longrightarrow \mathrm{N}_{2(g)} + \mathrm{CO}_{2(g)} + \mathrm{H}_2\mathrm{O}_{(l)}$$

Answer

Enthalpy change for a reaction ( $\Delta H$ ) is given by the expression,

 $\Delta H = \Delta U + \Delta n_g RT$ Where,  $\Delta U = \text{change in internal energy}$ 

 $\Delta n_g$  = change in number of moles

For the given reaction,

 $\Delta n_g = \Sigma n_g$  (products) –  $\Sigma n_g$  (reactants)

= (2 - 2.5) moles

 $\Delta n_g = -0.5$  moles

 $\Delta U = -742.7 \text{ kJ mol}^{-1}$ 

*T* = 298 K

 $R = 8.314 \times 10^{-3} \text{ kJ mol}^{-1} \text{ K}^{-1}$ 

Substituting the values in the expression of  $\Delta H$ :  $\Delta H = (-742.7 \text{ kJ mol}^{-1}) + (-0.5 \text{ mol}) (298 \text{ K}) (8.314 \times 10^{-3} \text{ kJ mol}^{-1} \text{ K}^{-1})$ = -742.7 - 1.2  $\Delta H = -743.9 \text{ kJ mol}^{-1}$ 

#### **Question 6.9:**

Calculate the number of kJ of heat necessary to raise the temperature of 60.0 g of aluminium from 35°C to 55°C. Molar heat capacity of Al is 24 J mol<sup>-1</sup> K<sup>-1</sup>.

itopper.H

#### Answer

From the expression of heat (q),

 $q = m. c. \Delta T$  Where,

c = molar heat capacity m

= mass of substance

 $\Delta T$  = change in temperature

Substituting the values in the expression of *q*:

$$q = \left(\frac{60}{27} \text{ mol}\right) (24 \text{ J mol}^{-1} \text{ K}^{-1}) (20 \text{ K})$$

$$q = 1066.7 \text{ J} q$$

$$= 1.07 \text{ kJ}$$

 $q = 1066.7 \, \mathrm{J} \, q$ = 1.07 kJ

**Question 6.10:** 

Calculate the enthalpy change on freezing of 1.0 mol of water at 10.0°C to ice at -

10.0°C.  $\Delta_{fus}H = 6.03 \text{ kJ mol}^{-1}$  at 0°C.

 $C_{\rho}[H_2O(I)] = 75.3 \text{ J mol}^{-1} \text{ K}^{-1}$ 

 $C_{\rho}[H_2O(s)] = 36.8 \text{ J mol}^{-1} \text{ K}^{-1}$ 

#### Answer

Total enthalpy change involved in the transformation is the sum of the following changes: Energy change involved in the transformation of 1 mol of water at 10°C to 1 mol (a) of water at 0°C.

Energy change involved in the transformation of 1 mol of water at 0° to 1 mol of (b) ice at 0°C.

(c) Energy change involved in the transformation of 1 mol of ice at  $0^{\circ}$ C to 1 mol of ice at  $-10^{\circ}$ C.

Total  $\Delta \mathbf{H} = C_p \left[ \mathbf{H}_2 \mathbf{OCl} \right] \Delta T + \Delta H_{\text{freezing}} + C_p \left[ \mathbf{H}_2 \mathbf{O}_{(s)} \right] \Delta T$ 

=  $(75.3 \text{ J} \text{ mol}^{-1} \text{ K}^{-1}) (0 - 10)\text{K} + (-6.03 \times 10^3 \text{ J} \text{ mol}^{-1}) + (36.8 \text{ J} \text{ mol}^{-1} \text{ K}^{-1}) (-10 - 0)\text{K}$ 

= -753 J mol<sup>-1</sup> - 6030 J mol<sup>-1</sup> - 368 J mol<sup>-1</sup>

= -7151 J mol<sup>-1</sup>

= -7.151 kJ mol<sup>-1</sup>

Hence, the enthalpy change involved in the transformation is  $-7.151 \text{ kJ mol}^{-1}$ .

**Question 6.11:** 

Enthalpy of combustion of carbon to  $CO_2$  is -393.5 kJ mol<sup>-1</sup>. Calculate the heat released upon formation of 35.2 g of  $CO_2$  from carbon and dioxygen gas.

Answer

Formation of CO<sub>2</sub> from carbon and dioxygen gas can be represented as:

 $C_{(s)} + O_{2(g)} \longrightarrow CO_{2(g)} \qquad \Delta_f H = -393.5 \text{ kJ mol}^{-1}$ 

(1 mole = 44 g)

Heat released on formation of 44 g  $CO_2 = -393.5$  kJ mol<sup>-1</sup>

Heat released on formation of 35.2 g CO<sub>2</sub>

$$= \frac{-393.5 \text{ kJ mol}^{-1}}{44 \text{ g}} \times 35.2 \text{ g}$$
$$= -314.8 \text{ kJ mol}^{-1}$$

**Question 6.12:** 

Enthalpies of formation of  $CO_{(g)}$ ,  $CO_{2(g)}$ ,  $N_2O_{(g)}$  and  $N_2O_{4(g)}$  are -110 kJ mol<sup>-1</sup>, -393 kJ mol<sup>-1</sup>, 81 kJ mol<sup>-1</sup> and 9.7 kJ mol<sup>-1</sup> respectively. Find the value of  $\Delta_r H$  for the reaction:

 $N_2O_{4(g)} + 3CO_{(g)} \longrightarrow N_2O_{(g)} + 3CO_{2(g)}$ 

Answer

 $\Delta_r H$  for a reaction is defined as the difference between  $\Delta_r H$  value of products and  $\Delta_r H$  value of reactants.

$$\Delta_{t}H = \sum \Delta_{f}H \text{ (products)} - \sum \Delta_{f}H \text{ (reactants)}$$

For the given reaction,

 $N_{2}O_{4(g)} + 3CO_{(g)} \longrightarrow N_{2}O_{(g)} + 3CO_{2(g)}$  $\Delta_{r}H = \left[ \left\{ \Delta_{f}H(N_{2}O) + 3\Delta_{f}H(CO_{2}) \right\} - \left\{ \Delta_{f}H(N_{2}O_{4}) + 3\Delta_{f}H(CO) \right\} \right]$ 

Substituting the values of  $\Delta_{fH}$  for N<sub>2</sub>O, CO<sub>2</sub>, N<sub>2</sub>O<sub>4</sub>, and CO from the question, we get:

 $\Delta_r H = \left[ \left\{ 81 \text{ kJ mol}^{-1} + 3(-393) \text{ kJ mol}^{-1} \right\} - \left\{ 9.7 \text{ kJ mol}^{-1} + 3(-110) \text{ kJ mol}^{-1} \right\} \right]$  $\Delta_r H = -777.7 \text{ kJ mol}^{-1}$ 

Hence, the value of  $\Delta_r H$  for the reaction is  $-777.7 \text{ kJ mol}^{-1}$ 

Question 6.13:

#### Given

 $N_{2(g)} + 3H_{2(g)} \longrightarrow 2NH_{3(g)}$ ;  $\Delta_r H^{\theta} = -92.4 \text{ kJ mol}^{-1}$ 

What is the standard enthalpy of formation of NH<sub>3</sub> gas?

#### Answer

Standard enthalpy of formation of a compound is the change in enthalpy that takes place during the formation of 1 mole of a substance in its standard form from its constituent elements in their standard state.

Re-writing the given equation for 1 mole of  $NH_{3(g)}$ ,

$$\frac{1}{2}N_{2(g)} + \frac{3}{2}H_{2(g)} \longrightarrow NH_{3(g)}$$

Standard enthalpy of formation of NH

3(g)

 $= \frac{1}{2} \Delta_r H^{\theta}$ 

= ½ (-92.4 kJ mol<sup>-1</sup>)

= -46.2 kJ mol<sup>-1</sup>

# Question 6.14:

Calculate the standard enthalpy of formation of CH<sub>3</sub>OH(*t*) from the following data:

 $CH_{3}OH_{(l)} + \frac{3}{2}O_{2(g)} \longrightarrow CO_{2(g)} + 2H_{2}O_{(l)}; \Delta_{r}H^{\theta} = -726 \text{ kJ mol}^{-1}$   $C_{(g)} + O_{2(g)} \longrightarrow CO_{2(g)}; \Delta_{c}H_{\theta} = -393 \text{ kJ mol}^{-1}$   $H_{2(g)} + \frac{1}{2}O_{2(g)} \longrightarrow H_{2}O_{(l)}; \Delta_{r}H^{\theta} = -286 \text{ kJ mol}^{-1}.$ 

#### Answer

The reaction that takes place during the formation of CH<sub>3</sub>OH<sub>(l)</sub> can be written as:

$$C_{(s)} + 2H_2O_{(g)} + \frac{1}{2}O_{2(g)} \longrightarrow CH_3OH_{(l)} (\mathbf{1})$$

The reaction (1) can be obtained from the given reactions by following the algebraic calculations as:

Equation (ii)  $+ 2 \times$  equation (iii) – equation (i)

$$\Delta f H_{\theta} \left[ CH_{3}OH_{(l)} \right] = \Delta c H_{\theta} + 2\Delta f H_{\theta} \left[ H_{2}O_{(l)} \right] - \Delta r H_{\theta}$$

 $= (-393 \text{ kJ mol}^{-1}) + 2(-286 \text{ kJ mol}^{-1}) - (-726 \text{ kJ mol}^{-1})$ 

= (-393 - 572 + 726) kJ mol<sup>-1</sup>

 $\Delta_{f}H^{\theta} \left[ CH_{3}OH_{(l)} \right] = -239 \text{ kJ mol}^{-1}$ 

**Question 6.15:** 

Calculate the enthalpy change for the process

 $\text{CCl}_{4(g)} \rightarrow \text{C}_{(g)} + 4\text{Cl}_{(g)}$  and calculate bond

enthalpy of C–Cl in  $CCl_{4(g)}$ .

 $\Delta_{vap}H^{\theta}$  (CCl<sub>4</sub>) = 30.5 kJ mol<sup>-1</sup>.

 $\Delta_f H^{\theta}$  (CCl<sub>4</sub>) = -135.5 kJ mol<sup>-1</sup>.

 $\Delta_a H^{\theta}$  (C) = 715.0 kJ mol<sup>-1</sup>, where  $\Delta_a H^{\theta}$  is enthalpy of atomisation

 $\Delta_a H^{\theta}$  (Cl<sub>2</sub>) = 242 kJ mol<sup>-1</sup>

## Answer

The chemical equations implying to the given values of enthalpies are:

(i) 
$$\operatorname{CCl}_{4(t)} \longrightarrow \operatorname{CCl}_{4(g)}_{\Delta_{Vap}}$$
  
(ii)  $C_{(s)} \longrightarrow C_{(g)}_{a} \oplus \Delta H = 715.0 \text{ kJ mol}^{-1}$   
(iii)  $\operatorname{Cl}_{2(g)} \longrightarrow 2\operatorname{Cl}_{(g)}_{a} \oplus \Delta H = 242 \text{ kJ mol}^{-1}$   
(iv)  $C_{(g)} + 4\operatorname{Cl}_{(g)} \longrightarrow \operatorname{CCl}_{4(g)} \Delta_{rH} = -135.5 \text{ kJ mol}^{-1}$   
Enthalpy change for the given process  $\operatorname{CCl}_{4(g)} \longrightarrow C_{(g)} + 4\operatorname{Cl}_{(g)}$  can be calculated using the following algebraic calculations as:  
Equation (ii) + 2 × Equation (iii) - Equation (i) - Equation (iv)  
 $\Delta H = \Delta_{a}H^{\theta}(C) + 2\Delta_{a}H^{\theta}(Cl_{2}) - \Delta_{vap}H^{\theta} - \Delta_{rH}$   
= (715.0 kJ mol<sup>-1</sup>) + 2(242 kJ mol<sup>-1</sup>) - (30.5 kJ mol<sup>-1</sup>) - (-135.5 kJ mol<sup>-1</sup>)  
 $\therefore \Delta H = 1304 \text{ kJ mol}^{-1}$   
Bond enthalpy of C-Cl bond in CCl<sub>4 (g)</sub>  
 $= \frac{1304}{4} \text{ kJ mol}^{-1}$   
= 326 kJ mol<sup>-1</sup>

 $=\frac{1304}{4}$  kJ mol<sup>-1</sup>

= 326 kJ mol<sup>-1</sup>

**Question 6.16:** 

For an isolated system,  $\Delta U = 0$ , what will be  $\Delta S$ ?

Answer

 $\Delta S$  will be positive i.e., greater than zero

Since  $\Delta U = 0$ ,  $\Delta S$  will be positive and the reaction will be spontaneous.

**Question 6.17:** 

For the reaction at 298 K,

 $2A + B \rightarrow C$ 

 $\Delta H$  = 400 kJ mol<sup>-1</sup> and  $\Delta S$  = 0.2 kJ K<sup>-1</sup> mol<sup>-1</sup>

At what temperature will the reaction become spontaneous considering  $\Delta H$  and  $\Delta S$  to be constant over the temperature range?

Answer

From the expression,

 $\Delta G = \Delta H - T \Delta S$ 

Assuming the reaction at equilibrium,  $\Delta T$  for the reaction would be:

$$T = \left(\Delta H - \Delta G\right) \frac{1}{\Delta S}$$
$$= \frac{\Delta H}{\Delta S}$$

 $(\Delta G = 0 \text{ at equilibrium})$ 

 $=\frac{400 \text{ kJ mol}^{-1}}{0.2 \text{ kJ K}^{-1} \text{ mol}^{-1}}$ 

## T = 2000 K

For the reaction to be spontaneous,  $\Delta G$  must be negative. Hence, for the given reaction to be spontaneous, T should be greater than 2000 K.

#### **Question 6.18:**

For the reaction,

 $2Cl_{(g)} \rightarrow Cl_{2(g)}$ , what are the signs of  $\Delta H$  and  $\Delta S$  ?

Answer

 $\Delta H$  and  $\Delta S$  are negative

The given reaction represents the formation of chlorine molecule from chlorine atoms. Here, bond formation is taking place. Therefore, energy is being released. Hence,  $\Delta H$  is negative.

Also, two moles of atoms have more randomness than one mole of a molecule. Since spontaneity is decreased,  $\Delta S$  is negative for the given reaction.

Question 6.19:

For the reaction

 $2\mathsf{A}(g)\,+\,\mathsf{B}(g)\,\rightarrow\,2\mathsf{D}(g)$ 

 $\Delta U^{\theta} = -10.5 \text{ kJ}$  and  $\Delta S^{\theta} = -44.1 \text{ JK}^{-1}$ .

Calculate  $\Delta G^{\theta}$  for the reaction, and predict whether the reaction may occur spontaneously. Answer

For the given reaction,

 $2 \mathsf{A}(g) + \mathsf{B}(g) \to 2\mathsf{D}(g)$ 

 $\Delta n_g = 2 - (3)$ 

= -1 mole

Substituting the value of  $\Delta U^{\theta}$  in the expression of  $\Delta H$ :

 $\Delta H^{\theta} = \Delta U^{\theta} + \Delta n_g \mathsf{R} T$ 

=  $(-10.5 \text{ kJ}) - (-1) (8.314 \times 10^{-3} \text{ kJ K}^{-1} \text{ mol}^{-1}) (298 \text{ K})$ 

= -10.5 kJ - 2.48 kJ

 $\Delta H^{\theta} = -12.98 \text{ kJ}$ 

Substituting the values of  $\Delta H^{\theta}$  and  $\Delta S^{\theta}$  in the expression of  $\Delta G^{\theta}$ :

 $\Delta G^{\theta} = \Delta H^{\theta} - T \Delta S^{\theta}$ 

= -12.98 kJ - (298 K) (-44.1 J K<sup>-1</sup>)

= -12.98 kJ + 13.14 kJ

 $\Delta G^{\theta} = + 0.16 \text{ kJ}$ 

Since  $\Delta G^{\theta}$  for the reaction is positive, the reaction will not occur spontaneously.

**Question 6.20:** 

The equilibrium constant for a reaction is 10. What will be the value of  $\Delta G^{\theta}$ ? R = 8.314 JK<sup>-</sup>

<sup>1</sup> mol<sup>-1</sup>, T = 300 K.

Answer

From the expression,

 $\Delta G^{\theta} = -2.303 \text{ RT} \log K_{eq}$ 

 $\Delta G^{\theta}$  for the reaction,

= (2.303) (8.314 JK<sup>-1</sup> mol<sup>-1</sup>) (300 K) log10

= -5744.14 Jmol<sup>-1</sup>

= -5.744 kJ mol<sup>-1</sup>

Question 6.21:

Comment on the thermodynamic stability of  $NO_{(g)}$ , given

$$\frac{1}{2} \sum_{N_{2}(g)} + \frac{1}{2} \sum_{O_{2}(g) \to NO(g)} ; \Delta r H_{\theta} = 90 \text{ kJ mol}_{-1}$$
$$\frac{1}{2} \sum_{O_{2}(g) \to NO_{2}(g)} : \Delta r H_{\theta} = -74 \text{ kJ mol}_{-1}$$

#### Answer

The positive value of  $\Delta_r H$  indicates that heat is absorbed during the formation of NO<sub>(g)</sub>. This means that NO<sub>(g)</sub> has higher energy than the reactants (N<sub>2</sub> and O<sub>2</sub>). Hence, NO<sub>(g)</sub> is unstable.

The negative value of  $\Delta_r H$  indicates that heat is evolved during the formation of NO<sub>2(g)</sub> from NO<sub>(g)</sub> and O<sub>2(g)</sub>. The product, NO<sub>2(g)</sub> is stabilized with minimum energy.

Hence, unstable  $NO_{(g)}$  changes to unstable  $NO_{2(g)}$ .

# Question 6.22:

Calculate the entropy change in surroundings when 1.00 mol of  $H_2O_{(l)}$  is formed under standard conditions.  $\Delta_f H^{\theta} = -286 \text{ kJ mol}^{-1}$ .

#### Answer

It is given that 286 kJ mol<sup>-1</sup> of heat is evolved on the formation of 1 mol of  $H_2O_{(l)}$ . Thus, an equal amount of heat will be absorbed by the surroundings.  $q_{surr} = +286$  kJ mol<sup>-1</sup>

 $\frac{q_{\text{surr}}}{7}$ 

Entropy change ( $\Delta S_{surr}$ ) for the surroundings = 286 kJ mol<sup>-1</sup>

 $=\frac{200 \text{ km}}{298 \text{ k}}$ 

 $\Delta S_{surr} = 959.73 \text{ J mol}^{-1} \text{ K}^{-1}$
