Three Dimensional Geometry

Short Answer Type Questions

Q. 1 Find the position vector of a point A in space such that \overrightarrow{OA} is inclined at 60° to OX and at 45° to OY and $|\overrightarrow{OA}| = 10$ units.

Sol. Since, \overrightarrow{OA} is inclined at 60° to OX and at 45° to OY. Let \overrightarrow{OA} makes angle α with OZ.

$$\begin{array}{lll}
\vdots & \cos^2 60^\circ + \cos^2 45^\circ + \cos^2 \alpha = 1 \\
\Rightarrow & \left(\frac{1}{2}\right)^2 + \left(\frac{1}{\sqrt{2}}\right)^2 + \cos^2 \alpha = 1 \\
\Rightarrow & \frac{1}{4} + \frac{1}{2} + \cos^2 \alpha = 1 \\
\Rightarrow & \cos^2 \alpha = 1 - \left(\frac{1}{2} + \frac{1}{4}\right) \\
\Rightarrow & \cos^2 \alpha = 1 - \left(\frac{6}{8}\right) \\
\Rightarrow & \cos^2 \alpha = \frac{1}{4} \\
\Rightarrow & \cos^2 \alpha = \frac{1}{2} = \cos 60^\circ \\
\vdots & \alpha = 60^\circ \\
\vdots & O\vec{A} = |\vec{OA}| \left(\frac{1}{2}\hat{\mathbf{i}} + \frac{1}{\sqrt{2}}\hat{\mathbf{j}} + \frac{1}{2}\hat{\mathbf{k}}\right) \\
&= 10 \left(\frac{1}{2}\hat{\mathbf{i}} + \frac{1}{\sqrt{2}}\hat{\mathbf{j}} + 5\hat{\mathbf{k}}\right) \\
&= 5\hat{\mathbf{i}} + 5\sqrt{2}\hat{\mathbf{j}} + 5\hat{\mathbf{k}}
\end{array} \quad \begin{bmatrix} \because |\vec{OA}| = 10 \end{bmatrix}$$

- \mathbf{Q} . **2** Find the vector equation of the line which is parallel to the vector $3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$ and which passes through the point (1, -2, 3).
 - **Thinking Process**

Here, we use the formula $\overrightarrow{\mathbf{r}} = \overrightarrow{\mathbf{b}} + \lambda \overrightarrow{\mathbf{a}}$, where $\overrightarrow{\mathbf{r}}$ is the equation of the line which passes through $\overrightarrow{\mathbf{b}}$ and parallel to $\overrightarrow{\mathbf{a}}$.

Sol. Let
$$\overrightarrow{\mathbf{a}} = 3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$$
 and $\overrightarrow{\mathbf{b}} = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$

So, vector equation of the line, which is parallel to the vector $\overrightarrow{\mathbf{a}} = 3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$ and passes through the vector $\vec{\mathbf{b}} = \hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$ is $\vec{\mathbf{r}} = \vec{\mathbf{b}} + \lambda \vec{\mathbf{a}}$.

$$\overrightarrow{\mathbf{r}} = (\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) + \lambda(3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}})$$

$$\Rightarrow (x \hat{\mathbf{i}} + y \hat{\mathbf{j}} + z\hat{\mathbf{k}}) - (\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 3\hat{\mathbf{k}}) = \lambda(3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}})$$

$$\Rightarrow (x - 1)\hat{\mathbf{i}} + (y + 2)\hat{\mathbf{j}} + (z - 3)\hat{\mathbf{k}} = \lambda(3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}})$$

Q. 3 Show that the lines
$$\frac{x-1}{2} = \frac{y-2}{3} = \frac{z-3}{4}$$
 and $\frac{x-4}{5} = \frac{y-1}{2} = z$ intersect. Also, find their point of intersection.

Thinking Process

If shortest distance between the lines is zero, then they intersect.

Sol. We have,
$$x_1 = 1$$
, $y_1 = 2$, $z_1 = 3$ and $a_1 = 2$, $b_1 = 3$, $c_1 = 4$ Also, $x_2 = 4$, $y_2 = 1$, $z_2 = 0$ and $a_2 = 5$, $b_2 = 2$, $c_2 = 1$

If two lines intersect, then shortest distance between them should be zero.

.. Shortest distance between two given lines

$$\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix}$$

$$= \frac{1}{\sqrt{(b_1c_2 - b_2c_1)^2 + (c_1a_2 - c_2a_1)^2 + (a_1b_2 - a_2b_1)^2}}$$

$$= \frac{1}{\sqrt{(3 \cdot 1 - 2 \cdot 4)^2 + (4 \cdot 5 - 1 \cdot 2)^2 + (2 \cdot 2 - 5 \cdot 3)^2}}$$

$$= \frac{1}{\sqrt{25 + 324 + 121}}$$

$$= \frac{3(3 - 8) + 1(2 - 20) - 3(4 - 15)}{\sqrt{470}}$$

$$= \frac{-15 - 18 + 33}{\sqrt{470}} = \frac{0}{\sqrt{470}} = 0$$

Therefore, the given two lines are intersecting

For finding their point of intersection for first line,

$$\frac{x-1}{2} = \frac{y-2}{3} = \frac{z-3}{4} = \lambda$$

 $x = 2\lambda + 1$, $y = 3\lambda + 2$ and $z = 4\lambda + 3$

Since, the lines are intersecting. So, let us put these values in the equation of another line.

Thus,
$$\frac{2\lambda + 1 - 4}{5} = \frac{3\lambda + 2 - 1}{2} = \frac{4\lambda + 3}{1}$$

$$\Rightarrow \frac{2\lambda - 3}{5} = \frac{3\lambda + 1}{2} = \frac{4\lambda + 3}{1}$$

$$\Rightarrow \frac{2\lambda - 3}{5} = \frac{4\lambda + 3}{1}$$

$$\Rightarrow 2\lambda - 3 = 20\lambda + 15$$

$$\Rightarrow 18\lambda = -18 = -1$$

So, the required point of intersection is

$$x = 2(-1) + 1 = -1$$

 $y = 3(-1) + 2 = -1$
 $z = 4(-1) + 3 = -1$

Thus, the lines intersect at (-1, -1, -1).

Q. 4 Find the angle between the lines

$$\vec{r} = 3\hat{i} - 2\hat{j} + 6\hat{k} + \lambda(2\hat{i} + \hat{j} + 2\hat{k})$$
 and $\vec{r} = (2\hat{j} - 5\hat{k}) + \mu(6\hat{i} + 3\hat{j} + 2\hat{k})$.

Thinking Process

Thinking Process

We know that, $\cos \theta = \frac{|\vec{\mathbf{b}}_1 \cdot \vec{\mathbf{b}}_2|}{|\vec{\mathbf{b}}_1| \cdot |\vec{\mathbf{b}}_2|}$, where, θ is the angle between the lines $\vec{\mathbf{a}}_1 + \lambda \vec{\mathbf{b}}_1$ and $\vec{\mathbf{a}}_2 + \mu \vec{\mathbf{b}}_2$.

The equation of $\vec{\mathbf{a}}_1 + \vec{\mathbf{b}}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_2 = \mathbf{a}_1 + \mathbf{b}_2 = \mathbf{a}_2 = \mathbf{a}_1 + \mathbf{b}_2 =$

: .

we have,
$$\mathbf{r} = 3\mathbf{i} - 2\mathbf{j} + 6\mathbf{k} + \lambda(2\mathbf{i} + \mathbf{j} + 2\mathbf{k})$$

and $\mathbf{r} = (2\hat{\mathbf{j}} - 5\hat{\mathbf{k}}) + \mu(6\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$
where, $\mathbf{a}_1 = 3\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 6\hat{\mathbf{k}}, \ \ \mathbf{b}_1 = 2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}$

and
$$\overrightarrow{\mathbf{a}}_{2} = 2\hat{\mathbf{j}} - 5\hat{\mathbf{k}}, \ \overrightarrow{\mathbf{b}}_{2} = 6\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$$

If θ is angle between the lines, then

$$\cos \theta = \frac{|\vec{\mathbf{b}_{1}} \cdot \vec{\mathbf{b}_{2}}|}{|\vec{\mathbf{b}_{1}}| \cdot |\vec{\mathbf{b}_{2}}|}$$

$$= \frac{|(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}) \cdot (6\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}})|}{|2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 2\hat{\mathbf{k}}||6\hat{\mathbf{i}} + 3\hat{\mathbf{j}} + 2\hat{\mathbf{k}}|}$$

$$= \frac{|12 + 3 + 4|}{\sqrt{9}\sqrt{49}} = \frac{19}{21}$$

$$\theta = \cos^{-1} \frac{19}{21}$$

- \mathbf{Q} . **5** Prove that the line through A(0, -1, -1) and B(4, 5, 1) intersects the line through C(3, 9, 4) and D(-4, 4, 4).
- **Sol.** We know that, the cartesian equation of a line that passes through two points (x_1, y_1, z_1) and (x_2, y_2, z_2) is

$$\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1}$$

Hence, the cartesian equation of line passes through
$$A(0, -1, -1)$$
 and $B(4, 5, 1)$ is
$$\frac{x-0}{4-0} = \frac{y+1}{5+1} = \frac{z+1}{1+1}$$

$$\Rightarrow \qquad \qquad \frac{x}{4} = \frac{y+1}{6} = \frac{z+1}{2} \qquad \qquad \dots (i)$$

and cartesian equation of the line passes through C(3, 9, 4) and D(-4, 4, 4) is

$$\frac{x-3}{-4-3} = \frac{y-9}{4-9} = \frac{z-4}{4-4}$$

$$\Rightarrow \frac{x-3}{-7} = \frac{y-9}{-5} = \frac{z-4}{0}$$
 ...(ii)

If the lines intersect, then shortest distance between both of them should be zero.

:. Shortest distance between the lines

So, the given lines intersect.

Q. 6 Prove that the lines x = py + q, z = ry + s and x = p'y + q', z = r'y + s'are perpendicular, if pp' + rr' + 1 = 0.

Sol. We have,
$$x = py + q \Rightarrow y = \frac{x - q}{p}$$
 ...(i) and $z = ry + s \Rightarrow y = \frac{z - s}{r}$ (ii) $\Rightarrow \frac{x - q}{p} = \frac{y}{1} = \frac{z - s}{r}$ [using Eqs. (i) and (ii)] ...(iii) Similarly, $\frac{x - q'}{p'} = \frac{y}{1} = \frac{z - s'}{r'}$ (iv)

From Eqs. (iii) and (iv),

and
$$a_1 = p, b_1 = 1, c_1 = r$$

and $a_2 = p', b_2 = 1, c_2 = r'$

If these given lines are perpendicular to each other, then

$$a_1 a_2 + b_1 b_2 + c_1 c_2 = 0$$

$$pp' + 1 + rr' = 0$$

which is the required condition.

$oldsymbol{Q}$. $oldsymbol{7}$ Find the equation of a plane which bisects perpendicularly the line joining the points A(2, 3, 4) and B(4, 5, 8) at right angles.

Since, the equation of a plane is bisecting perpendicular the line joining the points A(2, 3, 4) and B(4, 5, 8) at right angles

So, mid-point of AB is
$$\left(\frac{2+4}{2}, \frac{3+5}{2}, \frac{4+8}{2}\right)$$
 i.e., (3, 4, 6)

Also,
$$\vec{N} = (4-2)\hat{i} + (5-3)\hat{j} + (8-4)\hat{k} = 2\hat{i} + 2\hat{j} + 4\hat{k}$$

So, the required equation of the plane is $(\overrightarrow{\mathbf{r}} - \overrightarrow{\mathbf{a}}) \cdot \overrightarrow{\mathbf{N}} = 0$.

$$\Rightarrow [(x-3)\hat{\mathbf{i}} + (y-4)\hat{\mathbf{j}} + (z-6)\hat{\mathbf{k}}] \cdot (2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 4\hat{\mathbf{k}}) = 0$$

$$2x - 6 + 2y - 8 + 4z - 24 = 0$$

$$\Rightarrow [(x-3)\hat{\mathbf{i}} + (y-4)\hat{\mathbf{j}} + (z-6)\hat{\mathbf{k}}] \cdot (2\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 4\hat{\mathbf{k}}) = 0$$

$$\Rightarrow 2x - 6 + 2y - 8 + 4z - 24 = 0$$

$$\Rightarrow 2x + 2y + 4z = 38$$

$$\therefore \qquad \qquad x + y + 2z = 1$$

Q. 8 Find the equation of a plane which is at a distance
$$3\sqrt{3}$$
 units from origin and the normal to which is equally inclined to coordinate axis.

Sol. Since, normal to the plane is equally inclined to the coordinate axis.

Therefore,
$$\cos \alpha = \cos \beta = \cos \gamma = \frac{1}{\sqrt{3}}$$

So, the normal is $\vec{N} = \frac{1}{\sqrt{3}}\hat{i} + \frac{1}{\sqrt{3}}\hat{j} + \frac{1}{\sqrt{3}}\hat{k}$ and plane is at a distance of $3\sqrt{3}$ units from origin.

The equation of plane is $\mathbf{r} \cdot \hat{\mathbf{N}} = 3\sqrt{3}$

 $[: \vec{\mathbf{a}} = 3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} + 6\hat{\mathbf{k}}]$

[since, vector equation of the plane at a distance p from the origin is $\vec{\mathbf{r}} \cdot \hat{\mathbf{N}} = p$]

$$\Rightarrow (x \hat{\mathbf{i}} + y \hat{\mathbf{j}} + z \hat{\mathbf{k}}) \cdot \frac{\left(\frac{1}{\sqrt{3}} \hat{\mathbf{i}} + \frac{1}{\sqrt{3}} \hat{\mathbf{j}} + \frac{1}{\sqrt{3}} \hat{\mathbf{k}}\right)}{1} = 3\sqrt{3}$$

$$\Rightarrow \frac{x}{\sqrt{3}} + \frac{y}{\sqrt{3}} + \frac{z}{\sqrt{3}} = 3\sqrt{3}$$

$$x + y + z = 3\sqrt{3} \cdot \sqrt{3} = 9$$

So, the required equation of plane is x + y + z = 9.

- **Q. 9** If the line drawn from the point (-2, -1, -3) meets a plane at right angle at the point (1, -3, 3), then find the equation of the plane.
- **Sol.** Since, the line drawn from the point (-2, -1, -3) meets a plane at right angle at the point (1, -3, 3). So, the plane passes through the point (1, -3, 3) and normal to plane is $(-3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} 6\hat{\mathbf{k}})$.

$$\Rightarrow \qquad \qquad \overrightarrow{\mathbf{a}} = \hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$$
 and
$$\overrightarrow{\mathbf{N}} = -3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 6\hat{\mathbf{k}}$$
 So, the equation of required plane is $(\overrightarrow{\mathbf{r}} - \overrightarrow{\mathbf{a}}) \cdot \overrightarrow{\mathbf{N}} = 0$
$$\Rightarrow \qquad [(x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) - (\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 3\hat{\mathbf{k}})] \cdot (-3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 6\hat{\mathbf{k}}) = 0$$

$$\Rightarrow \qquad [(x - 1)\hat{\mathbf{i}} + (y + 3)\hat{\mathbf{j}} + (z - 3)\hat{\mathbf{k}}] \cdot (-3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 6\hat{\mathbf{k}}) = 0$$

$$\Rightarrow \qquad -3x + 3 + 2y + 6 - 6z + 18 = 0$$

$$\Rightarrow \qquad -3x + 2y - 6z = -27$$

$$\therefore \qquad 3x - 2y + 6z - 27 = 0$$

- **Q. 10** Find the equation of the plane through the points (2, 1, 0), (3, -2, -2) and (3, 1, 7).
 - **Thinking Process**

Here, apply the equation of the plane passing through the points (x_1, y_1, z_1) , (x_2, y_2, z_2) and (x_3, y_3, z_3) is given by $\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} = 0.$

Sol. We know that, the equation of a plane passing through three non-collinear points (x_1, y_1, z_1) , (x_2, y_2, z_2) and (x_3, y_3, z_3) is

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ x_3 - x_1 & y_3 - y_1 & z_3 - z_1 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x - 2 & y - 1 & z - 0 \\ 3 - 2 & -2 - 1 & -2 - 0 \\ 3 - 2 & 1 - 1 & 7 - 0 \end{vmatrix} = 0$$

$$\Rightarrow \begin{vmatrix} x - 2 & y - 1 & z \\ 1 & -3 & -2 \\ 1 & 0 & 7 \end{vmatrix} = 0$$

$$\Rightarrow (x - 2)(-21 + 0) - (y - 1)(7 + 2) + z(3) = 0$$

$$\Rightarrow -21x + 42 - 9y + 9 + 3z = 0$$

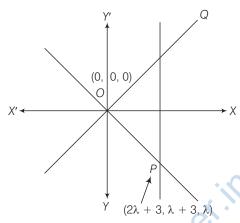

$$\Rightarrow -21x - 9y + 3z = -51$$

$$7x + 3y - z = 17$$

So, the required equation of plane is 7x + 3y - z = 17.

Q. 11 Find the equations of the two lines through the origin which intersect the line $\frac{x-3}{2} = \frac{y-3}{1} = \frac{z}{1}$ at angles of $\frac{\pi}{3}$ each.

Sol. Given equation of the line is
$$\frac{x-3}{2} = \frac{y-3}{1} = \frac{z}{1} = \lambda$$
 ...(i)

So, DR's of the line are 2, 1, 1 and DC's of the given line are $\frac{2}{\sqrt{6}}$, $\frac{1}{\sqrt{6}}$, $\frac{1}{\sqrt{16}}$.

Also, the required lines make angle $\frac{\pi}{3}$ with the given line.

From Eq. (i),
$$x = (2\lambda + 3), \ y = (\lambda + 3) \ \text{and} \ z = \lambda$$

$$\vdots \qquad \cos \theta = \frac{a_1 a_2 + b_1 b_2 + c_1 c_2}{\sqrt{a_1^2 + b_1^2 + c_1^2} \sqrt{a_2^2 + b_2^2 + c_2^2}}$$

$$\vdots \qquad \cos \frac{\pi}{3} = \frac{(4\lambda + 6) + (\lambda + 3) + (\lambda)}{\sqrt{6} \sqrt{(2\lambda + 3)^2 + (\lambda + 3)^2 + \lambda^2}}$$

$$\Rightarrow \qquad \frac{1}{2} = \frac{6\lambda + 9}{\sqrt{6} \sqrt{(4\lambda^2 + 9 + 12\lambda + \lambda^2 + 9 + 6\lambda + \lambda^2)}}$$

$$\Rightarrow \qquad \frac{\sqrt{6}}{2} = \frac{6\lambda + 9}{\sqrt{6\lambda^2 + 18\lambda + 18}}$$

$$\Rightarrow \qquad 6\sqrt{(\lambda^2 + 3\lambda + 3)} = 2(6\lambda + 9)$$

$$\Rightarrow \qquad 36(\lambda^2 + 3\lambda + 3) = 36(4\lambda^2 + 9 + 12\lambda)$$

$$\Rightarrow \qquad \lambda^2 + 3\lambda + 3 = 4\lambda^2 + 9 + 12\lambda$$

$$\Rightarrow \qquad 3\lambda^2 + 9\lambda + 6 = 0$$

$$\Rightarrow \qquad \lambda^2 + 3\lambda + 2 = 0$$

$$\Rightarrow \qquad \lambda(\lambda + 2) + 1(\lambda + 2) = 0$$

 $\therefore \qquad \qquad \lambda = -1, \, -2$

 $(\lambda + 1)(\lambda + 2) = 0$

So, the DC's are 1, 2, -1 and -1, 1, -2. Also, both the required lines passes through origin.

So, the equations of required lines are $\frac{x}{1} = \frac{y}{2} = \frac{z}{-1}$ and $\frac{x}{-1} = \frac{y}{1} = \frac{z}{-2}$.

- **Q. 12** Find the angle between the lines whose direction cosines are given by the equation l + m + n = 0 and $l^2 + m^2 n^2 = 0$.
- **Sol.** Eliminating n from both the equations, we have

$$l^{2} + m^{2} - (l - m)^{2} = 0$$

$$\Rightarrow l^{2} + m^{2} - l^{2} - m^{2} + 2ml = 0 \Rightarrow 2lm = 0$$

$$\Rightarrow lm = 0 \Rightarrow (-m - n)m = 0$$

$$\Rightarrow (m + n)m = 0$$

$$\Rightarrow m = -n \Rightarrow m = 0$$

$$\Rightarrow l = 0, l = -n$$

Thus, Dr's two lines are proportional to 0, -n, n and -n, 0, n i.e., 0, -1, 1 and -1, 0, 1.

So, the vector parallel to these given lines are $\vec{a} = -\hat{j} + \hat{k}$ and $\vec{b} = -\hat{i} + \hat{k}$

Now,
$$\cos \theta = \frac{\overrightarrow{\mathbf{a}} \overrightarrow{\mathbf{b}}}{|\overrightarrow{\mathbf{a}}||\overrightarrow{\mathbf{b}}|} = \frac{1}{\sqrt{2}} \cdot \frac{1}{\sqrt{2}} \implies \cos \theta = \frac{1}{2}$$

$$\therefore \qquad \qquad \theta = \frac{\pi}{3} \qquad \qquad \qquad \boxed{\because \cos \frac{\pi}{3} = \frac{1}{2}}$$

- **Q. 13** If a variable line in two adjacent positions has direction cosines l, m, n and $l + \delta l$, $m + \delta m$, $n + \delta n$, then show that the small angle $\delta \theta$ between the two positions is given by $\delta \theta^2 = \delta l^2 + \delta m^2 + \delta n^2$.
- **Sol.** We have l, m, n and $l + \delta l$, $m + \delta m$, $n + \delta n$ as direction cosines of a variable line in two different positions.

Now, $\overrightarrow{\mathbf{a}}$ and $\overrightarrow{\mathbf{b}}$ are unit vectors along a line with direction cosines l, m, n and $(l + \delta l)$, $(m + \delta m)$, $(n + \delta n)$, respectively.

$$\vec{\mathbf{a}} = l\hat{\mathbf{i}} + m\hat{\mathbf{j}} + n\hat{\mathbf{k}} \text{ and } \vec{\mathbf{b}} = (l + \delta l)\hat{\mathbf{i}} + (m + \delta m)\hat{\mathbf{j}} + (n + \delta n)\hat{\mathbf{k}}$$

$$\Rightarrow \qquad \cos \delta\theta = \frac{\vec{\mathbf{a}} \cdot \vec{\mathbf{b}}}{|\vec{\mathbf{a}}| |\vec{\mathbf{b}}|} = \vec{\mathbf{a}} \cdot \vec{\mathbf{b}} \qquad [\because |\hat{\mathbf{a}}| = |\hat{\mathbf{b}}| = 1]$$

$$\Rightarrow \qquad \cos \delta\theta = l(l + \delta l) + m(m + \delta m) + n(n + \delta n)$$

$$= (l^2 + m^2 + n^2) + (l\delta l + m\delta m + n\delta n)$$

$$= 1 - \frac{1}{2}(\delta l^2 + \delta m^2 + \delta n^2)$$

$$\Rightarrow \qquad 2(1 - \cos \delta\theta) = (\delta l^2 + \delta m^2 + \delta n^2)$$

$$\Rightarrow \qquad 2 \cdot 2 \sin^2 \frac{\delta\theta}{2} = \delta l^2 + \delta m^2 + \delta n^2$$

$$[\because 1 - \cos \theta = 2 \sin^2 \frac{\theta}{2}]$$

$$\Rightarrow \qquad 4\left(\frac{\delta\theta}{2}\right)^2 = \delta \ l^2 + \delta \ m^2 + \delta \ n^2 \qquad \left[\text{since, } \frac{\delta\theta}{2} \text{ is small, then sin } \frac{\delta\theta}{2} = \frac{\delta\theta}{2}\right]$$

$$\therefore \qquad \delta \; \theta^2 = \delta \; l^2 + \delta \, m^2 + \delta \, n^2$$

- \mathbf{Q} . 14 If 0 is the origin and A is (a, b, c), then find the direction cosines of the line OA and the equation of plane through A at right angle to OA.
- **Sol.** Since, DC's of line OA are $\frac{a}{\sqrt{a^2 + b^2 + c^2}}$, $\frac{b}{\sqrt{a^2 + b^2 + c^2}}$ and $\frac{c}{\sqrt{a^2 + b^2 + c^2}}$.

 $\overrightarrow{\mathbf{n}} = \overrightarrow{\mathbf{OA}} = \overrightarrow{\mathbf{a}} = a\hat{\mathbf{i}} + b\hat{\mathbf{i}} + c\hat{\mathbf{k}}$ Also.

The equation of plane passes through (a, b, c) and perpendicular to OA is given by

$$|\vec{r} - \vec{a}| \cdot \vec{n} = 0$$

$$\Rightarrow \qquad r \cdot \vec{n} = \vec{a} \cdot \vec{n}$$

$$\Rightarrow \qquad [(x\hat{i} + y\hat{j} + z\hat{k}) \cdot (a\hat{i} + b\hat{j} + c\hat{k})] = (a\hat{i} + b\hat{j} + c\hat{k}) \cdot (a\hat{i} + b\hat{j} + c\hat{k})$$

$$\Rightarrow \qquad ax + by + cz = a^2 + b^2 + c^2$$

- \mathbf{Q} . **15** Two systems of rectangular axis have the same origin. If a plane cuts them at distances a, b, c and a', b', c', respectively from the origin, then prove that $\frac{1}{a^2} + \frac{1}{h^2} + \frac{1}{c^2} = \frac{1}{a'^2} + \frac{1}{h'^2} + \frac{1}{c'^2}$.
- **Sol.** Consider OX, OY, OZ and ox, oy, oz are two system of rectangular axes. Let their corresponding equation of plane be

...(i)

 $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ $\frac{x}{a'} + \frac{y}{b'} + \frac{z}{c'} = 1$...(ii)

Also, the length of perpendicular from origin to Eqs. (i) and (ii) must be same.

$$\frac{\frac{0}{a} + \frac{0}{b} + \frac{0}{c} - 1}{\sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}} = \frac{\frac{0}{a'} + \frac{0}{b'} + \frac{0}{c'} - 1}{\sqrt{\frac{1}{a'^2} + \frac{1}{b'^2} + \frac{1}{c'^2}}}$$

$$\Rightarrow \sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}} = \sqrt{\frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2}}$$

$$\Rightarrow \frac{1}{a^2} + \frac{1}{b^2} + \frac{1}{c^2} = \frac{1}{a^2} + \frac{1}{b'^2} + \frac{1}{c'^2}$$

Long Answer Type Questions

- Q. 16 Find the foot of perpendicular from the point (2, 3, -8) to the line $\frac{4-x}{2} = \frac{y}{6} = \frac{1-z}{3}$. Also, find the perpendicular distance from the given point to the line.
- **Sol.** We have, equation of line as $\frac{4-x}{2} = \frac{y}{6} = \frac{1-z}{3}$

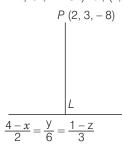

$$\Rightarrow \frac{x-4}{-2} = \frac{y}{6} = \frac{z-1}{-3} = \lambda$$

 $x = -2 \lambda + 4$, $y = 6 \lambda$ and $z = -3 \lambda + 1$ \Rightarrow

Let the coordinates of L be $(4-2\lambda, 6\lambda, 1-3\lambda)$ and direction ratios of PL are proportional to $(4-2\lambda-2, 6\lambda-3, 1-3\lambda+8)$ i.e., $(2-2\lambda, 6\lambda-3, 9-3\lambda)$.

Also, direction ratios are proportional to -2, 6, -3. Since, PL is perpendicular to give line.

So, the coordinates of L are $(4-2\lambda, 6\lambda, 1-3\lambda)$ i.e., (2, 6, -2).

length of $PL = \sqrt{(2-2)^2 + (6-3)^2 + (-2+8)^2}$ = $\sqrt{0+9+36} = 3\sqrt{5}$ units Also,

Q. 17 Find the distance of a point (2, 4, -1) from the line

$$\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9}$$

 $\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9}.$ **Sol.** We have, equation of the line as $\frac{x+5}{1} = \frac{y+3}{4} = \frac{z-6}{-9} = \lambda$

$$\Rightarrow \qquad x = \lambda - 5, \ y = 4\lambda - 3, \ z = 6 - 9\lambda$$

Let the coordinates of L be $(\lambda - 5, 4\lambda - 3, 6 - 9\lambda)$, then Dr's of PL are $(\lambda - 7, 4\lambda - 7, 7 - 9\lambda)$.

Also, the direction ratios of given line are proportional to 1, 4, -9.

Since, PL is perpendicular to the given line.

$$(\lambda - 7) \cdot 1 + (4\lambda - 7) \cdot 4 + (7 - 9\lambda) \cdot (-9) = 0$$

$$\Rightarrow \lambda - 7 + 16\lambda - 28 + 81\lambda - 63 = 0$$

$$\Rightarrow$$
 98 $\lambda = 98 \Rightarrow \lambda = 1$

So, the coordinates of L are (-4, 1, -3).

Required distance,
$$PL = \sqrt{(-4-2)^2 + (1-4)^2 + (-3+1)^2}$$

= $\sqrt{36+9+4} = 7$ units

Q. 18 Find the length and the foot of perpendicular from the point $\left(1, \frac{3}{2}, 2\right)$ to the plane 2x - 2y + 4z + 5 = 0.

Sol. Equation of the given plane is
$$2x - 2y + 4z + 5 = 0$$
 ... (i)

$$\Rightarrow \qquad \overrightarrow{\mathbf{n}} = 2\hat{\mathbf{i}} - 2\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$$

So, the equation of line through $\left(1, \frac{3}{2}, 2\right)$ and parallel to $\overrightarrow{\mathbf{n}}$ is given by

$$\frac{x-1}{2} = \frac{y-3/2}{-2} = \frac{z-2}{4} = \lambda$$

$$\Rightarrow x = 2\lambda + 1, y = -2\lambda + \frac{3}{2} \text{ and } z = 4\lambda + 2$$

If this point lies on the given plane, then

$$2 (2\lambda + 1) - 2\left(-2 \lambda + \frac{3}{2}\right) + 4 (4\lambda + 2) + 5 = 0$$
 [using Eq. (i)]
$$4\lambda + 2 + 4\lambda - 3 + 16\lambda + 8 + 5 = 0$$

$$24\lambda = -12 \Rightarrow \lambda = \frac{-1}{2}$$

.. Required foot of perpendicular

$$= \left[2 \times \left(\frac{-1}{2}\right) + 1, -2 \times \left(\frac{-1}{2}\right) + \frac{3}{2}, 4 \times \left(\frac{-1}{2}\right) + 2\right] \textit{i.e.}, \ \left(0, \frac{5}{2}, 0\right)$$

- $\therefore \text{ Required length of perpendicular} = \sqrt{(1-0)^2 + \left(\frac{3}{2} \frac{5}{2}\right)^2 + (2-0)^2}$ $= \sqrt{1+1+4} = \sqrt{6} \text{ units}$
- **Q. 19** Find the equation of the line passing through the point (3, 0, 1) and parallel to the planes x + 2y = 0 and 3y z = 0.
- **Sol.** Equation of the two planes are x + 2y = 0 and 3y z = 0. Let $\overrightarrow{\mathbf{n}}_1$ and $\overrightarrow{\mathbf{n}}_2$ are the normals to the two planes, respectively.

$$\vec{n}_1 = \hat{i} + 2\hat{j} \text{ and } \vec{n}_2 = 3\hat{j} - \hat{k}$$

Since, required line is parallel to the given two planes.

Therefore,

 \Rightarrow

 \Rightarrow

$$\vec{\mathbf{b}} = \vec{\mathbf{n}}_1 \times \vec{\mathbf{n}}_2 = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & 2 & 0 \\ 0 & 3 & -1 \end{vmatrix}$$
$$= \hat{\mathbf{i}} (-2) - \hat{\mathbf{j}} (-1) + \hat{\mathbf{k}} (3)$$
$$= -2 \hat{\mathbf{i}} + \hat{\mathbf{j}} + 3 \hat{\mathbf{k}}$$

So, the equation of the lines through the point (3, 0, 1) and parallel to the given two planes are

$$(x-3)\,\hat{\mathbf{i}} + (y-0)\hat{\mathbf{j}} + (z-1)\,\hat{\mathbf{k}} + \lambda\,(-2\,\hat{\mathbf{i}} + \hat{\mathbf{j}} + 3\,\hat{\mathbf{k}})$$

$$\Rightarrow \qquad (x-3)\,\hat{\mathbf{i}} + y\,\hat{\mathbf{j}} + (z-1)\,\hat{\mathbf{k}} + \lambda\,(-2\,\hat{\mathbf{i}} + \hat{\mathbf{j}} + 3\,\hat{\mathbf{k}})$$

- **Q. 20** Find the equation of the plane through the points (2, 1, -1), (-1, 3, 4) and perpendicular to the plane x 2y + 4z = 10.
- **Sol.** The equation of the plane passing through (2, 1, -1) is

$$a(x-2) + b(y-1) + c(z+1) = 0$$
 ...(i)

Sicne, this passes through (-1, 3, 4).

∴
$$a(-1-2) + b(3-1) + c(4+1) = 0$$

⇒ $-3a + 2b + 5c = 0$... (ii)

Since, the plane (i) is perpendicular to the plane x - 2y + 4z = 10.

On solving Eqs. (ii) and (iii), we get

$$\frac{a}{8+10} = \frac{-b}{-17} = \frac{c}{4} = \lambda$$

 $\Rightarrow \qquad \qquad a = 18 \, \lambda, \, b = 17 \, \lambda, \, c = 4\lambda$

From Eq. (i),
$$18 \lambda(x-2) + 17 \lambda(y-1) + 4\lambda(z+1) = 0$$

$$\Rightarrow 18x - 36 + 17y - 17 + 4z + 4 = 0$$

$$\Rightarrow 18x + 17y + 4z - 49 = 0$$

$$\therefore 18x + 17y + 4z = 49$$

Q. 21 Find the shortest distance between the lines gives by

$$\vec{r} = (8 + 3\lambda)\hat{i} - (9 + 16\lambda)\hat{j} + (10 + 7\lambda)\hat{k}$$
and
$$\vec{r} = 15\hat{i} + 29\hat{j} + 5\hat{k} + \mu (3\hat{i} + 8\hat{j} - 5\hat{k}).$$
Sol. We have,
$$\vec{r} = (8 + 3\lambda)\hat{i} - (9 + 16\lambda)\hat{j} + (10 + 7\lambda)\hat{k}$$

$$= 8\hat{i} - 9\hat{j} + 10\hat{k} + 3\lambda\hat{i} - 16\lambda\hat{j} + 7\lambda\hat{k}$$

$$= 8\hat{i} - 9\hat{j} + 10\hat{k} + \lambda(3\hat{i} - 16\hat{j} + 7\hat{k})$$

$$\Rightarrow \qquad \vec{a_1} = 8\hat{i} - 9\hat{j} + 10\hat{k} \text{ and } \vec{b_1} = 3\hat{i} - 16\hat{j} + 7\hat{k}$$

$$\Rightarrow \qquad \vec{r} = 15\hat{i} + 29\hat{j} + 5\hat{k} + \mu (3\hat{i} + 8\hat{j} - 5\hat{k})$$

$$\Rightarrow \qquad \vec{a_2} = 15\hat{i} + 29\hat{j} + 5\hat{k} \text{ and } \vec{b_2} = 3\hat{i} + 8\hat{j} - 5\hat{k}$$

$$\Rightarrow \qquad \vec{a_2} = 15\hat{i} + 29\hat{j} + 5\hat{k} \text{ and } \vec{b_2} = 3\hat{i} + 8\hat{j} - 5\hat{k}$$

$$\therefore \qquad \vec{b_1} \times \vec{b_2} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 3 & -16 & 7 \\ 3 & 8 & -5 \end{vmatrix}$$

$$= \hat{i}(80 - 56) - \hat{j}(-15 - 21) + \hat{k}(24 + 48)$$

$$= 24\hat{i} + 36\hat{j} + 72\hat{k}$$

Now,
$$|\vec{\mathbf{b}_1} \times \vec{\mathbf{b}_2}| = \sqrt{(24)^2 + (36)^2 + (72)^2}$$

$$= 12 \sqrt{2^2 + 3^2 + 6^2} = 84$$
and
$$(\vec{\mathbf{a}_2} - \vec{\mathbf{a}_1}) = (15 - 8)\hat{\mathbf{i}} + (29 + 9)\hat{\mathbf{j}} + (5 - 10)\hat{\mathbf{k}}$$

$$= 7\hat{\mathbf{i}} + 38\hat{\mathbf{j}} - 5\hat{\mathbf{k}}$$

$$\therefore \text{ Shortest distance} = \left| \frac{(24\hat{\mathbf{i}} + 36\hat{\mathbf{j}} + 72\hat{\mathbf{k}}) \cdot (7\hat{\mathbf{i}} + 38\hat{\mathbf{j}} - 5\hat{\mathbf{k}})}{84} \right|$$

$$= \left| \frac{168 + 1368 - 360}{94} \right| = \left| \frac{1176}{94} \right| = 14 \text{ units}$$

- **Q. 22** Find the equation of the plane which is perpendicular to the plane 5x + 3y + 6z + 8 = 0 and which contains the line of intersection of the planes x + 2y + 3z 4 = 0 and 2x + y z + 5 = 0.
- **Sol.** The equation of a plane through the line of intersection of the planes x + 2y + 3z 4 = 0 and 2x + y z + 5 = 0 is

$$(x + 2y + 3z - 4) + \lambda (2x + y - z + 5) = 0$$

$$\Rightarrow x (1 + 2\lambda) + y (2 + \lambda) + z (-\lambda + 3) - 4 + 5\lambda = 0 \qquad ...(i)$$

- **Q. 23** If the plane ax + by = 0 is rotated about its line of intersection with the plane z = 0 through an angle α , then prove that the equation of the plane in its new position is $ax + by \pm (\sqrt{a^2 + b^2} \tan \alpha) z = 0$.
- **Sol.** Equation of the plane is ax + by = 0... (i) :. Equation of the plane after new position is

$$\frac{ax \cos \alpha}{\sqrt{a^2 + b^2}} + \frac{by \cos \alpha}{\sqrt{b^2 + a^2}} \pm z \sin \alpha = 0$$

$$\Rightarrow \frac{ax}{\sqrt{a^2 + b^2}} + \frac{by}{\sqrt{b^2 + a^2}} \pm z \tan \alpha = 0 \qquad \text{[on dividing by } \cos \alpha\text{]}$$

$$\Rightarrow ax + by \pm z \tan \alpha \sqrt{\alpha^2 + b^2} = 0 \qquad \text{[on multiplying with } \sqrt{a^2 + b^2}\text{]}$$

Alternate Method

Given, planes are and

Therefore, the equation of any plane passing through the line of intersection of planes

(i) and (ii) may be taken as ax + by + k = 0.

Then, direction cosines of a normal to the plane (iii) are
$$\frac{a}{\sqrt{a^2+b^2+k^2}}$$
, $\frac{b}{\sqrt{a^2+b^2+k^2}}$, $\frac{c}{\sqrt{a^2+b^2+k^2}}$ and direction cosines of the normal to the plane (i) are $\frac{a}{\sqrt{a^2+b^2}}$, $\frac{b}{\sqrt{a^2+b^2}}$, 0.

Since, the angle between the planes (i) and (ii) is α ,

$$\therefore \qquad \cos \alpha = \frac{a \cdot a + b \cdot b + k \cdot 0}{\sqrt{a^2 + b^2 + k^2} \sqrt{a^2 + b^2}}$$

$$= \sqrt{\frac{a^2 + b^2}{a^2 + b^2 + k^2}}$$

$$\Rightarrow \qquad k^2 \cos^2 \alpha = a^2 (1 - \cos^2 \alpha) + b^2 (1 - \cos^2 \alpha)$$

$$\Rightarrow \qquad k^2 = \frac{(a^2 + b^2) \sin^2 \alpha}{\cos^2 \alpha}$$

$$k = \pm \sqrt{a^2 + b^2} \tan \alpha$$

On putting this value in plane (iii), we get the equation of the plane as

$$ax + by + z\sqrt{a^2 + b^2} \tan \alpha = 0$$

Q. 24 Find the equation of the plane through the intersection of the planes $\vec{r} \cdot (\hat{i} + 3\hat{j}) - 6 = 0$ and $\vec{r} \cdot (3\hat{i} - \hat{j} - 4\hat{k}) = 0$, whose perpendicular distance from origin is unity.

Sol. We have,
$$\overrightarrow{\mathbf{n}_1} = (\hat{\mathbf{i}} + 3\hat{\mathbf{j}}), d_1 = 6$$
 and $\overrightarrow{\mathbf{n}_2} = (3\hat{\mathbf{i}} - \hat{\mathbf{j}} - 4\hat{\mathbf{k}}), d_2 = 0$
Using the relation, $\overrightarrow{\mathbf{r}} \cdot (\overrightarrow{\mathbf{n}_1} + \lambda \overrightarrow{\mathbf{n}_2}) = d_1 + d_2\lambda$

$$\Rightarrow \overrightarrow{\mathbf{r}} \cdot [(\hat{\mathbf{i}} + 3\hat{\mathbf{j}}) + \lambda (3\hat{\mathbf{i}} - \hat{\mathbf{j}} - 4\hat{\mathbf{k}})] = 6 + 0 \cdot \lambda$$

$$\Rightarrow \overrightarrow{\mathbf{r}} \cdot [(1 + 3\lambda)\hat{\mathbf{i}} + (3 - \lambda)\hat{\mathbf{j}} + \hat{\mathbf{k}} (-4\lambda)] = 6 \qquad ...(i)$$
On dviding both sides by $\sqrt{(1 + 3\lambda)^2 + (3 - \lambda)^2 + (-4\lambda)^2}$, we get

n aviding both sides by
$$\sqrt{(1+3\lambda)^2+(3-\lambda)^2+(-4\lambda)^2}$$
, we get

$$\frac{\overset{\longrightarrow}{r} \cdot [(1+3\lambda)\hat{\mathbf{i}} + (3-\lambda)\hat{\mathbf{j}} + \hat{\mathbf{k}}(-4\lambda)]}{\sqrt{(1+3\lambda)^2 + (3-\lambda)^2 + (-4\lambda)^2}} = \frac{6}{\sqrt{(1+3\lambda)^2 + (3-\lambda)^2 + (-4\lambda)^2}}$$

Since, the perpendicular distance from origin is unity.

$$\frac{6}{\sqrt{(1+3\lambda)^2 + (3-\lambda)^2 + (-4\lambda)^2}} = 1$$

$$\Rightarrow \qquad (1+3\lambda)^2 + (3-\lambda)^2 + (-4\lambda)^2 = 36$$

$$\Rightarrow \qquad 1+9\lambda^2 + 6\lambda + 9 + \lambda^2 - 6\lambda + 16\lambda^2 = 36$$

$$\Rightarrow \qquad 26\lambda^2 + 10 = 36$$

$$\Rightarrow \qquad \lambda^2 = 1$$

$$\therefore \qquad \lambda = \pm 1$$

Using Eq. (i), the required equation of plane is

$$\vec{r} \cdot [(1 \pm 3)\hat{i} + (3 \mp 1)\hat{j} + (\mp 4)\hat{k}] = 6$$

$$\Rightarrow \qquad \vec{r} \cdot [(1 + 3)\hat{i} + (3 - 1)\hat{j} + (-4)\hat{k}] = 6$$
and
$$\vec{r} \cdot [(1 - 3)\hat{i} + (3 + 1)\hat{j} + 4\hat{k}] = 6$$

$$\Rightarrow \qquad \vec{r} \cdot (4\hat{i} + 2\hat{j} - 4\hat{k}) = 6$$
and
$$\vec{r} \cdot (-2\hat{i} + 4\hat{j} + 4\hat{k}) = 6$$

$$\Rightarrow \qquad 4x + 2y - 4z - 6 = 0$$
and
$$-2x + 4y + 4z - 6 = 0$$

- **Q. 25** Show that the points $(\hat{\mathbf{i}} \hat{\mathbf{j}} + 3\hat{\mathbf{k}})$ and $3(\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}})$ are equidistant from the plane $\overrightarrow{\mathbf{r}} \cdot (5\hat{\mathbf{i}} + 2\hat{\mathbf{j}} 7\hat{\mathbf{k}}) + 9 = 0$ and lies on opposite side of it.
- **Sol.** To show that these given points $(\hat{\mathbf{i}} \hat{\mathbf{j}} + 3\hat{\mathbf{k}})$ and $3(\hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}})$ are equidistant from the plane $\vec{\mathbf{r}} \cdot (5\hat{\mathbf{i}} + 2\hat{\mathbf{j}} 7\hat{\mathbf{k}}) + 9 = 0$, we first find out the mid-point of the points which is $2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 3\hat{\mathbf{k}}$.

On substituting \overrightarrow{r} by the mid-point in plane, we get

LHS =
$$(2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 3\hat{\mathbf{k}}) \cdot (5\hat{\mathbf{i}} + 2\hat{\mathbf{j}} - 7\hat{\mathbf{k}}) + 9$$

= $10 + 2 - 21 + 9 = 0$
= RHS

Hence, the two points lie on opposite sides of the plane are equidistant from the plane.

Q. 26 $\overrightarrow{AB} = 3\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$ and $\overrightarrow{CD} = -3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$ are two vectors. The position vectors of the points A and C are $6\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$ and $-9\hat{\mathbf{i}} + 2\hat{\mathbf{k}}$, respectively. Find the position vector of a point P on the line AB and a point Q on the line CD such that \overrightarrow{PQ} is perpendicular to \overrightarrow{AB} and \overrightarrow{CD} both.

Sol. We have,
$$\overrightarrow{AB} = 3\hat{i} - \hat{j} + \hat{k}$$
 and $\overrightarrow{CD} = -3\hat{i} + 2\hat{j} + 4\hat{k}$

Also, the position vectors of \vec{A} and \vec{C} are $6\hat{i} + 7\hat{j} + 4\hat{k}$ and $-9\hat{j} + 2\hat{k}$, respectively. Since, \vec{PQ} is perpendicular to both \vec{AB} and \vec{CD} .

So, P and Q will be foot of perpendicular to both the lines through A and C.

Now, equation of the line through A and parallel to the vector \overrightarrow{AB} is,

$$\overrightarrow{\mathbf{r}} = (6\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 4\hat{\mathbf{k}}) + \lambda(3\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}})$$

and the line through C and parallel to the vector \overrightarrow{CD} is given by

$$\vec{r} = -9\hat{j} + 2\hat{k} + \mu (-3\hat{i} + 2\hat{j} + 4\hat{k})$$
 ...(i)

Let

$$\vec{\mathbf{r}} = (6\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 4\hat{\mathbf{k}}) + \lambda (3\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}})$$

and
$$\overrightarrow{r} = -9\hat{\mathbf{j}} + 2\hat{\mathbf{k}} + \mu \left(-3\hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 4\hat{\mathbf{k}} \right) \qquad ...(ii)$$

Let $P(6 + 3\lambda, 7 - \lambda, 4 + \lambda)$ is any point on the first line and Q be any point on second line is given by $(-3\mu, -9 + 2\mu, 2 + 4\mu)$.

$$\overrightarrow{PQ} = (-3\mu - 6 - 3\lambda)\hat{i} + (-9 + 2\mu - 7 + \lambda)\hat{j} + (2 + 4\mu - 4 - \lambda)\hat{k}$$
$$= (-3\mu - 6 - 3\lambda)\hat{i} + (2\mu + \lambda - 16)\hat{j} + (4\mu - \lambda - 2)\hat{k}$$

If PQ is perpendicular to the first line, then

If PQ is perpendicular to the second line, then

$$\begin{array}{c} -3 \left(-3 \mu -6-3 \lambda \right)+2 \left(2 \mu +\lambda -16\right)+4 \left(4 \mu -\lambda -2\right)=0 \\ \Rightarrow 9 \mu +18+9 \lambda +4 \mu +2 \lambda -32 \right. \\ \left.+16 \mu -4 \lambda -8=0 \right. \\ \Rightarrow 29 \mu +7 \lambda -22=0 \end{array} \text{(iv)}$$

On solving Eqs. (iii) and (iv), we get

Using μ in Eq. (iii), we get

$$\overrightarrow{PQ} = [-3(1) - 6 - 3(-1)] \hat{\mathbf{i}} + [2(1) + (-1) - 16] \hat{\mathbf{j}} + [4(1) - (-1) - 2] \hat{\mathbf{k}}$$
$$= -6\hat{\mathbf{i}} - 15\hat{\mathbf{i}} + 3\hat{\mathbf{k}}$$

Q. 27 Show that the straight lines whose direction cosines are given by 2l + 2m - n = 0 and mn + nl + lm = 0 are at right angles.

Sol. We have,
$$2l + 2m - n = 0$$
 ...(i) and $mn + nl + lm = 0$...(ii)

Eliminating m from the both equations, we get

$$m = \frac{n-2l}{2}$$
 [from Eq. (i)]

$$\Rightarrow \left(\frac{n-2l}{2}\right)n + nl + l\left(\frac{n-2l}{2}\right) = 0$$

$$\Rightarrow \frac{n^2 - 2nl + 2nl + nl - 2l^2}{2} = 0$$

$$\Rightarrow n^2 + nl - 2l^2 = 0$$

$$\Rightarrow n^2 + 2nl - nl - 2l^2 = 0$$

$$\Rightarrow (n+2l)(n-l) = 0$$

$$\Rightarrow n = -2l \text{ and } n = l$$

$$\therefore m = \frac{-2l-2l}{2}, m = \frac{l-2l}{2}$$

$$\Rightarrow m = -2l, m = \frac{-l}{2}$$

Thus, the direction ratios of two lines are proportional to l, -2l, -2 and l, $\frac{-l}{2}$, l.

$$\Rightarrow 1, -2, -2 \text{ and } 1, \frac{-1}{2}, 1$$

$$\Rightarrow 1, -2, -2 \text{ and } 2, -1, 2$$

Also, the vectors parallel to these lines are $\vec{a} = \hat{i} - 2\hat{j} - 2\hat{k}$ and $\vec{b} = 2\hat{i} - \hat{j} + 2\hat{k}$, respectively.

$$\begin{array}{ll}
\vdots & \cos\theta = \frac{\overrightarrow{\mathbf{a}} \cdot \overrightarrow{\mathbf{b}}}{|\overrightarrow{\mathbf{a}}| |\overrightarrow{\mathbf{b}}|} = \frac{(\widehat{\mathbf{i}} - 2\widehat{\mathbf{j}} - 2\widehat{\mathbf{k}}) \cdot (2\widehat{\mathbf{i}} - \widehat{\mathbf{j}} + 2\widehat{\mathbf{k}})}{3 \cdot 3} \\
& = \frac{2 + 2 - 4}{9} = 0 \\
\vdots & \theta = \frac{\pi}{2} \\
\end{array}$$

$$\begin{bmatrix}
\vdots \cos\frac{\pi}{2} = 0
\end{bmatrix}$$

Q. 28 If l_1 , m_1 , n_1 , l_2 , m_2 , n_2 and l_3 , m_3 , n_3 are the direction cosines of three mutually perpendicular lines, then prove that the line whose direction cosines are proportional to $l_1 + l_2 + l_3$, $m_1 + m_2 + m_3$ and $n_1 + n_2 + n_3$ makes equal angles with them.

Sol. Let
$$\vec{\mathbf{a}} = l_1 \hat{\mathbf{i}} + m_1 \hat{\mathbf{j}} + n_1 \hat{\mathbf{k}}$$

$$\vec{\mathbf{b}} = l_2 \hat{\mathbf{i}} + m_2 \hat{\mathbf{j}} + n_2 \hat{\mathbf{k}}$$

$$\vec{\mathbf{c}} = l_3 \hat{\mathbf{i}} + m_3 \hat{\mathbf{j}} + n_3 \hat{\mathbf{k}}$$

$$\vec{\mathbf{d}} = (l_1 + l_2 + l_3) \hat{\mathbf{i}} + (m_1 + m_2 + m_2) \hat{\mathbf{j}} + (n_1 + n_2 + n_3) \hat{\mathbf{k}}$$

Also, let α , β and γ are the angles between $\overrightarrow{\mathbf{a}}$ and $\overrightarrow{\mathbf{d}}$, $\overrightarrow{\mathbf{b}}$ and $\overrightarrow{\mathbf{d}}$, $\overrightarrow{\mathbf{c}}$ and $\overrightarrow{\mathbf{d}}$.

$$\therefore \cos \alpha = l_1 (l_1 + l_2 + l_3) + m_1 (m_1 + m_2 + m_3) + n_1 (n_1 + n_2 + n_3)$$

$$= l_1^2 + l_1 l_2 + l_1 l_3 + m_1^2 + m_1 m_2 + m_1 m_3 + n_1^2 + n_1 n_2 + n_1 n_3$$

$$= (l_1^2 + m_1^2 + n_1^2) + (l_1 \ l_2 + l_1 \ l_3 + m_1 \ m_2 + m_1 \ m_3 + n_1 \ n_2 + n_1 \ n_3)$$

$$= 1 + 0 = 1$$

$$[\because \ l_1^2 + m_1^2 + n_1^2 = 1 \ \text{and} \ l_1 \perp l_2, \ l_1 \perp l_3, \ m_1 \perp m_2, \ m_1 \perp m_3, \ n_1 \perp n_2, \ n_1 \perp n_3]$$
Similarly, $\cos \beta = l_2 \ (l_1 + l_2 + l_3) + m_2 \ (m_1 + m_2 + m_3) + n_2 \ (n_1 + n_2 + n_3)$

$$= 1 + 0 \ \text{and} \ \cos \gamma = 1 + 0$$

$$\Rightarrow$$
 $\cos \alpha = \cos \beta = \cos \gamma$

$$\Rightarrow$$
 $\alpha = \beta = \gamma$

So, the line whose direction cosines are proportional to $l_1 + l_2 + l_3$, $m_1 + m_2 + m_3$, $n_1 + n_2 + n_3$ makes equal angles with the three mutually perpendicular lines whose direction cosines are l_1 , m_1 , n_1 , l_2 , m_2 , n_2 and l_3 , m_3 , n_3 respectively.

Objective Type Questions

Q. 29 Distance of the point (α, β, γ) from *Y*-axis is

(c)
$$|\beta| + |\gamma|$$

(b)
$$|\beta|$$

(d) $\sqrt{\alpha^2 + \gamma^2}$

Sol. (d) Required distance =
$$\sqrt{(\alpha - 0)^2 + (\beta - \beta)^2 + (\gamma - 0)^2} = \sqrt{\alpha^2 + \gamma^2}$$

 \mathbf{Q} . **30** If the direction cosines of a line are k, k and k, then

(a)
$$k > 0$$

(b)
$$0 < k < 1$$

(c)
$$k = 1$$

(d)
$$k = \frac{1}{\sqrt{3}}$$
 or $-\frac{1}{\sqrt{3}}$

Since, direction cosines of a line are k, k and k. **Sol.** (*d*)

$$l = k, m = k \text{ and } n = k$$
 We know that,
$$l^2 + m^2 + n^2 = 1$$

$$l^2 + m^2 + n^2 = 1$$

$$k^2 + k^2 + k^2 = 1$$

$$\Rightarrow$$

$$k^2 = \frac{1}{3}$$

$$k = \pm \frac{1}{\sqrt{3}}$$

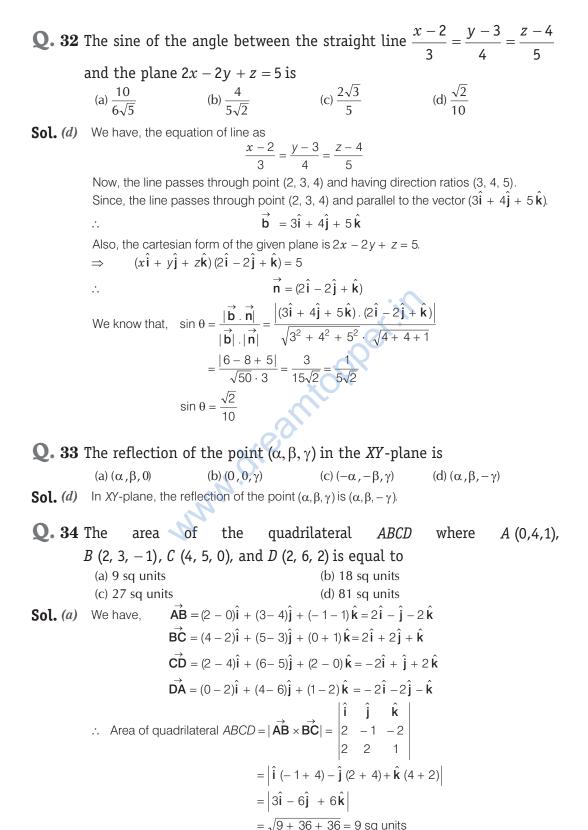

- **Q. 31** The distance of the plane $\vec{\mathbf{r}} \left(\frac{2}{7} \hat{\mathbf{i}} + \frac{3}{7} \hat{\mathbf{j}} \frac{6}{7} \hat{\mathbf{k}} \right) = 1$ from the origin is
 - (a) 1

(b) 7

(c) $\frac{1}{7}$

- (d) None of these
- **Sol.** (a) The distance of the plane $\vec{r} \left(\frac{2}{7} \hat{i} + \frac{3}{7} \hat{j} \frac{6}{7} \hat{k} \right) = 1$ from the origin is 1.

[since, $\overrightarrow{\mathbf{r}} \cdot \overrightarrow{\mathbf{n}} = d$ is the form of above equation, where d represents the distance of plane from the origin *i.e.*, d = 1]

- (a) a pair of perpendicular lines
- (b) a pair of parallel lines
- (c) a pair of parallel planes
- (d) a pair of perpendicular planes

$$xy + yz = 0$$

$$\Rightarrow$$

$$xy = -yz$$

So, a pair of perpendicular planes.

Q. 36 If the plane 2x - 3y + 6z - 11 = 0 makes an angle $\sin^{-1} \alpha$ with X-axis, then the value of α is

(a)
$$\frac{\sqrt{3}}{2}$$

(b)
$$\frac{\sqrt{2}}{3}$$

(c)
$$\frac{2}{7}$$

(d)
$$\frac{3}{7}$$

Sol. (c) Since, 2x - 3y + 6z - 11 = 0 makes an angle $\sin^{-1} \alpha$ with X-axis.

$$\vec{\mathbf{b}} = (1\hat{\mathbf{i}} + 0\hat{\mathbf{j}} + 0\hat{\mathbf{k}})$$
 and $\vec{\mathbf{n}} = 2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$

$$\sin \theta = \frac{|\overrightarrow{\mathbf{b}} \cdot \overrightarrow{\mathbf{n}}|}{|\overrightarrow{\mathbf{b}}| \cdot |\overrightarrow{\mathbf{n}}|}$$

hat,
$$\sin \theta = \frac{|\vec{\mathbf{b}} \cdot \vec{\mathbf{n}}|}{|\vec{\mathbf{b}}| \cdot |\vec{\mathbf{n}}|}$$

$$= \frac{|(\vec{\mathbf{i}} \cdot \vec{\mathbf{n}})|}{|\vec{\mathbf{b}}| \cdot |\vec{\mathbf{n}}|}$$

$$= \frac{|(\vec{\mathbf{i}} \cdot (2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 6\hat{\mathbf{k}}))|}{\sqrt{1}\sqrt{4 + 9 + 36}} = \frac{2}{7}$$

Fillers

 \mathbf{Q} . 37 If a plane passes through the points (2, 0,0) (0, 3, 0) and (0, 0, 4) the equation of plane is

Sol. We know that, equation of a the plane that cut the coordinate axes at (a, 0, 0) (0, b, 0) and (0, 0, c) is $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$.

Hence, the equation of plane passes through the points (2, 0, 0), (0, 3, 0) and (0, 0, 4) is $\frac{x}{2} + \frac{y}{3} + \frac{z}{4} = 1.$

- **Q.** 39 The vector equation of the line $\frac{x-5}{3} = \frac{y+4}{7} = \frac{z-6}{2}$ is
- **Sol.** We have, $\overrightarrow{\mathbf{a}} = 5\hat{\mathbf{i}} 4\hat{\mathbf{j}} + 6\hat{\mathbf{k}}$ and $\overrightarrow{\mathbf{b}} = 3\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$

So, the vector equation will be

$$\overrightarrow{\mathbf{r}} = (5\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 6\hat{\mathbf{k}}) + \lambda(3\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$\Rightarrow (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) - (5\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 6\hat{\mathbf{k}}) = \lambda(3\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$\Rightarrow (x-5)\hat{i} + (y+4)\hat{j} + (z-6)\hat{k} = \lambda(3\hat{i} + 7\hat{j} + 2\hat{k})$$

- \mathbf{Q} . **40** The vector equation of the line through the points (3, 4, –7) and (1, –1, 6) is
- Sol. We know that, vector equation of a line passes through two points is represented by $\overrightarrow{r} = \overrightarrow{a} + \lambda (\overrightarrow{b} - \overrightarrow{a})$

Here,
$$\overrightarrow{\mathbf{r}} = x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + 3\hat{\mathbf{k}}$$
, $\overrightarrow{\mathbf{a}} = 3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 7\hat{\mathbf{k}}$

$$\vec{\mathbf{b}} = \hat{\mathbf{i}} - \hat{\mathbf{j}} + 6\hat{\mathbf{k}}$$

$$\vec{\mathbf{b}} = \hat{\mathbf{i}} - \hat{\mathbf{j}} + 6\hat{\mathbf{k}}$$
$$(\vec{\mathbf{b}} - \vec{\mathbf{a}}) = -2\hat{\mathbf{i}} - 5\hat{\mathbf{j}} + 13\hat{\mathbf{k}}$$

$$x\hat{i} + y\hat{j} + z\hat{k} = 3\hat{i} + 4\hat{j} - 7\hat{k} + \lambda(-2\hat{i} - 5\hat{j} + 13\hat{k})$$

So, the required equation is
$$x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}} = 3\hat{\mathbf{i}} + 4\hat{\mathbf{j}} - 7\hat{\mathbf{k}} + \lambda(-2\hat{\mathbf{i}} - 5\hat{\mathbf{j}} + 13\hat{\mathbf{k}})$$

$$\Rightarrow (x - 3)\hat{\mathbf{i}} + (y - 4)\hat{\mathbf{j}} + (z + 7)\hat{\mathbf{k}} = \lambda(-2\hat{\mathbf{i}} - 5\hat{\mathbf{j}} + 13\hat{\mathbf{k}})$$

- **Q. 41** The cartesian equation of the plane $\vec{r} \cdot (\hat{i} + \hat{j} \hat{k}) = 2$ is
- Sol. We have,

$$\overrightarrow{\mathbf{r}} \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) = 2$$

$$\Rightarrow$$

$$\Rightarrow (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) \cdot (\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) = 2$$

$$\Rightarrow x + y - z = 2$$
which is the required form

$$x + y - z = 2$$

True/False

Q. 42 The unit vector normal to the plane x + 2y + 3z - 6 = 0 is

$$\frac{1}{\sqrt{14}}\,\hat{\mathbf{i}}\,+\frac{2}{\sqrt{14}}\,\hat{\mathbf{j}}\,+\frac{3}{\sqrt{14}}\,\hat{\mathbf{k}}\ .$$

Sol. True

We have.

$$\vec{n} = \hat{i} + 2\hat{j} + 3\hat{k}$$

$$\vec{n} = \hat{i} + 2\hat{j} + 3\hat{k}$$

$$\hat{n} = \frac{\hat{i} + 2\hat{j} + 3\hat{k}}{\sqrt{1^2 + 2^2 + 3^2}} = \frac{\hat{i}}{\sqrt{14}} + \frac{2\hat{j}}{\sqrt{14}} + \frac{3\hat{k}}{\sqrt{14}}$$

- **Q. 43** The intercepts made by the plane 2x 3y + 5z + 4 = 0 on the coordinate axis are -2, $\frac{4}{3}$ and $-\frac{4}{5}$.
- Sol. True

We have,

$$2x - 3y + 5z + 4 = 0$$

$$2x - 3y + 5z = -4$$

$$\frac{2x}{-4} - \frac{3y}{-4} + \frac{5z}{-4} = 1$$

$$\Rightarrow \qquad \frac{x}{-2} + \frac{y}{4} - \frac{z}{4} = 1$$

$$\Rightarrow \qquad \frac{x}{-2} + \frac{y}{4} + \frac{z}{-4} = 1$$

So, the intercepts are -2, $\frac{4}{3}$ and $-\frac{4}{5}$.

- **Q. 44** The angle between the line $\vec{r} = (5\hat{i} \hat{j} 4\hat{k}) + \lambda (2\hat{i} \hat{j} + \hat{k})$ and the plane $\vec{r} (3\hat{i} 4\hat{j} \hat{k}) + 5 = 0$ is $\sin^{-1} \left(\frac{5}{2\sqrt{91}} \right)$.
- Sol. False

We have, $\vec{b} = 2\hat{i} - \hat{j} + \hat{k}$ and $\vec{n} = 3\hat{i} - 4\hat{j} - \hat{k}$

Let θ is the angle between line and plane.

∴.

between line and plane.
$$\sin \theta = \frac{|\vec{\mathbf{b}} \cdot \vec{\mathbf{n}}|}{|\vec{\mathbf{b}}| \cdot |\vec{\mathbf{n}}|} = \frac{|(2\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}) \cdot (3\hat{\mathbf{i}} - 4\hat{\mathbf{j}} - \hat{\mathbf{k}})|}{\sqrt{6} \cdot \sqrt{26}}$$

$$= \frac{|6 + 4 - 1|}{\sqrt{156}} = \frac{9}{2\sqrt{39}}$$

$$\theta = \sin^{-1} \frac{9}{2\sqrt{3}}$$

- **Q. 45** The angle between the planes \vec{r} $(2\hat{i} 3\hat{j} + \hat{k}) = 1$ and \vec{r} $(\hat{i} \hat{j}) = 4$ is $\cos^{-1}\left(\frac{-5}{\sqrt{58}}\right)$.
- Sol. False

We know that, the angle between two planes is given by $\cos\theta = \frac{|\overrightarrow{n_1} \cdot \overrightarrow{n_2}|}{|\overrightarrow{n_1}| |\overrightarrow{n_2}|}$

Here,
$$\overrightarrow{n_1} = (2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + \hat{\mathbf{k}}) \text{ and } \overrightarrow{n_2} = (\hat{\mathbf{i}} - \hat{\mathbf{j}})$$

$$\therefore \qquad \cos \theta = \frac{\left| (2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + \hat{\mathbf{k}}) (\hat{\mathbf{i}} - \hat{\mathbf{j}}) \right|}{\sqrt{4 + 9 + 1} \sqrt{1 + 1}}$$

$$\Rightarrow \qquad \cos \theta = \frac{|2+3|}{\sqrt{14} \cdot \sqrt{2}} = \frac{5}{2\sqrt{7}}$$

$$\theta = \cos^{-1}\left(\frac{5}{2\sqrt{7}}\right)$$

Q. 46 The line
$$\mathbf{r} = 2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - \hat{\mathbf{k}} + \lambda (\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$
 lies in the plane $\mathbf{r} = (3\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) + 2 = 0$.

Sol. False

We have,
$$\overrightarrow{\mathbf{r}} = 2\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - \hat{\mathbf{k}} + \lambda (\hat{\mathbf{i}} - \hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

$$\Rightarrow (x\hat{\mathbf{i}} + y\hat{\mathbf{j}} + z\hat{\mathbf{k}}) = \hat{\mathbf{i}} (2 + \lambda) + \hat{\mathbf{j}} (-3 - \lambda) + \hat{\mathbf{k}} (-1 + 2\lambda)$$

Since, $x = (2 + \lambda)$, $y = (-3 - \lambda)$ and $z = (-1 + 2\lambda)$ are coordinates of general point which should satisfy the equation of the given plane.

$$\therefore [(2 + \lambda) \hat{\mathbf{i}} + (-3 - \lambda) \hat{\mathbf{j}} + (2\lambda - 1) \hat{\mathbf{k}}] \cdot [\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}] = 2$$

$$\Rightarrow (2 + \lambda) - 3 - \lambda - 2\lambda + 1 = 2$$

$$\Rightarrow -2\lambda = 2$$

$$\Rightarrow \lambda = -1$$

$$\therefore \hat{\mathbf{r}} = (2 - 1) \hat{\mathbf{i}} + (-3 + 1) \hat{\mathbf{j}} + (-2 - 1) \hat{\mathbf{k}}$$

$$= \hat{\mathbf{i}} - 2\hat{\mathbf{i}} - 3\hat{\mathbf{k}}$$

Again, from the equation of the plane

$$\vec{\mathbf{r}} \cdot (3\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) + 2 = 0$$

$$\Rightarrow \qquad (\hat{\mathbf{i}} - 2\hat{\mathbf{j}} - 3\hat{\mathbf{k}}) \ (3\hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}) + 2 = 0$$

$$\Rightarrow \qquad (3 - 2 + 3) + 2 = 0$$

$$\Rightarrow \qquad 6 \neq 0$$

which is not true.

So, the line $\vec{r} = 2\hat{i} - 3\hat{j} - \hat{k} + \lambda(\hat{i} - \hat{j} + 2\hat{k})$ does not lie in a plane.

Q. 47 The vector equation of the line
$$\frac{x-5}{3} = \frac{y+4}{7} = \frac{z-6}{2}$$
 is

$$\overrightarrow{\mathbf{r}} = 5\widehat{\mathbf{i}} - 4\widehat{\mathbf{j}} + 6\widehat{\mathbf{k}} + \lambda \left(3\widehat{\mathbf{i}} + 7\widehat{\mathbf{j}} + 2\widehat{\mathbf{k}}\right)$$

Sol. True

We have,
$$x = 5, y = -4, z = 6$$
 and
$$a = 3, b = 7, c = 2$$

$$\therefore \qquad \mathbf{r} = (5\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 6\hat{\mathbf{k}}) + \lambda (3\hat{\mathbf{i}} + 7\hat{\mathbf{j}} + 2\hat{\mathbf{k}})$$

Q. 48 The equation of a line, which is parallel to $2\hat{\mathbf{i}} + \hat{\mathbf{j}} + 3\hat{\mathbf{k}}$ and which passes through the point (5, -2, 4) is $\frac{x-5}{2} = \frac{y+2}{-1} = \frac{z-4}{3}$.

Here,
$$x_1 = 5, y_1 = -2, z_1 = 4$$
 and $a = 2, b = 1, c = 3$
$$\Rightarrow \frac{x-5}{2} = \frac{y+2}{1} = \frac{z-4}{3}$$

Q. 49 If the foot of perpendicular drawn from the origin to a plane is (5, -3, -2), then the equation of plane is $\mathbf{r} (5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) = 38$.

Sol. True

Since, the required plane passes through the point P(5, -3, -2) and is perpendicular to \overrightarrow{OP} .

$$\vec{\mathbf{a}} = 5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}$$

and
$$\overrightarrow{\mathbf{n}} = \overrightarrow{\mathbf{OP}} = 5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}$$

Now, the equation of the plane is

$$(\overrightarrow{\mathbf{r}} - \overrightarrow{\mathbf{a}}) \cdot \overrightarrow{\mathbf{n}} = 0$$

$$\Rightarrow \qquad \overrightarrow{r} \cdot \overrightarrow{n} = \overrightarrow{a} \cdot \overrightarrow{n}$$

$$\Rightarrow \qquad \overrightarrow{\mathbf{r}} \cdot (5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) = (5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) \cdot (5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}})$$

$$\Rightarrow \qquad \overrightarrow{r} \cdot (5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) = (3\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) \cdot (3\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) = 38$$

$$\Rightarrow \qquad \overrightarrow{r} \cdot (5\hat{\mathbf{i}} - 3\hat{\mathbf{j}} - 2\hat{\mathbf{k}}) = 38$$

$$\Rightarrow \qquad \overrightarrow{r} \cdot (5\hat{i} - 3\hat{j} - 2\hat{k}) = 38$$
